Żaba

Żabowate (Ranidae), tzw. żaby właściwe należą do gromady płazów bezogonowych. Do żabowatych należy 16 rodzajów i ok. 340 gatunków. W Polsce spotkasz np.: żabę jeziorkową, żabę wodną, żabę śmieszkę, żabę moczarową, żabę dalmatyńską oraz żabę trawną. Najbardziej żarłoczna jest śmieszka której dorosły osobnik potrafi zjeść traszki, młode padalce oraz drobne ssaki. Niestety liczebność żab w ostatnim okresie drastycznie spada. Główny wpływ wywiera na to działalność gospodarcza człowieka która kurczy naturalne środowisko życia i rozmnazania się płazów. Pamiętajmy by je chronić. W Polsce ochroną gatunkową objęte są wszystkie krajowe gatunki płazów. Wyjątkiem czasowy objęte są: żaba wodna i śmieszka, bo jedynie w okresie od 01 marca do 31 maja.
